# Heuristic Construction of Linear Codes with prescribed Automorphism Group 

Johannes Zwanzger<br>University of Bayreuth

Soria Summer School July 2008
(1) Basic definitions

2 Diophantine inequations in coding theory
(3) Prescription of automorphisms
(4) A heuristic solution algorithm
(5) Results

- A linear code $C$ over $\mathbb{F}_{q}$ of blocklength $n$ and dimension $k$ is a $k$-dimensional subspace of $\mathbb{F}_{q}^{n}$
- A linear code $C$ over $\mathbb{F}_{q}$ of blocklength $n$ and dimension $k$ is a $k$-dimensional subspace of $\mathbb{F}_{q}^{n}$
- elements of $C$ are called codewords and written as row vectors
- A linear code $C$ over $\mathbb{F}_{q}$ of blocklength $n$ and dimension $k$ is a $k$-dimensional subspace of $\mathbb{F}_{q}^{n}$
- elements of $C$ are called codewords and written as row vectors
- weight $w t(c)$ of $c \in C$ : number of nonzero components in $c$
- A linear code $C$ over $\mathbb{F}_{q}$ of blocklength $n$ and dimension $k$ is a $k$-dimensional subspace of $\mathbb{F}_{q}^{n}$
- elements of $C$ are called codewords and written as row vectors
- weight $w t(c)$ of $c \in C$ : number of nonzero components in $c$
- Hamming distance between $c, c^{\prime} \in C$ : $\operatorname{dist}\left(c, c^{\prime}\right):=w t\left(c-c^{\prime}\right)$
- A linear code $C$ over $\mathbb{F}_{q}$ of blocklength $n$ and dimension $k$ is a $k$-dimensional subspace of $\mathbb{F}_{q}^{n}$
- elements of $C$ are called codewords and written as row vectors
- weight $w t(c)$ of $c \in C$ : number of nonzero components in $c$
- Hamming distance between $c, c^{\prime} \in C$ : $\operatorname{dist}\left(c, c^{\prime}\right):=w t\left(c-c^{\prime}\right)$
- The minimum distance of $C$ is the minimum Hamming distance between any two different codewords of $C$.
- A linear code $C$ over $\mathbb{F}_{q}$ of blocklength $n$ and dimension $k$ is a $k$-dimensional subspace of $\mathbb{F}_{q}^{n}$
- elements of $C$ are called codewords and written as row vectors
- weight $w t(c)$ of $c \in C$ : number of nonzero components in $c$
- Hamming distance between $c, c^{\prime} \in C$ : $\operatorname{dist}\left(c, c^{\prime}\right):=w t\left(c-c^{\prime}\right)$
- The minimum distance of $C$ is the minimum Hamming distance between any two different codewords of $C$.
- $C$ has minimum distance $d \Rightarrow$ up to $\left\lfloor\frac{d-1}{2}\right\rfloor$ errors can be corrected

## Lemma

Existence of a linear $k$-dimensional code over $\mathbb{F}_{q}$ with blocklength $n$ and minimum distance $d$

Existence of a (multi-)set $P$ of $n$ points in $P G(k-1, q)$ so that for every hyperplane $H$ holds: $|H \cap P| \leq n-d$.

## Corollary

The search of linear ( $n, k, d, q$ )-codes is equivalent to looking for solutions of the following diophantine (in-)equation system:
where $x \in \mathbb{N}_{0}^{m}$ and $M_{q}^{k}$ is the $m \times m$ incidence matrix between points (columns) and hyperplanes (rows) in $\operatorname{PG}(k-1, q)$.

## Corollary

The search of linear $(n, k, d, q)$-codes is equivalent to looking for solutions of the following diophantine (in-)equation system:
where $x \in \mathbb{N}_{0}^{m}$ and $M_{q}^{k}$ is the $m \times m$ incidence matrix between points (columns) and hyperplanes (rows) in $\operatorname{PG}(k-1, q)$.

Problem: m gets huge very fast!

## A possible approach:

## A possible approach:

- Prescribe a subgroup $A$ of $\operatorname{PGL}(k, q)$ which must be contained in the automorphism group of the point (multi-) set $P$

## A possible approach:

- Prescribe a subgroup $A$ of $\operatorname{PGL}(k, q)$ which must be contained in the automorphism group of the point (multi-) set $P$
- $a \in P G L(k, q)$ is automorphism of $P$ iff $[p \in P \Leftrightarrow a(p) \in P]$

## A possible approach:

- Prescribe a subgroup $A$ of $\operatorname{PGL}(k, q)$ which must be contained in the automorphism group of the point (multi-) set $P$
- $a \in P G L(k, q)$ is automorphism of $P$ iff $[p \in P \Leftrightarrow a(p) \in P]$
- Instead of choosing single points of $P G(k-1, q)$, we now select complete orbits under the action of $A$ on the points

## A possible approach:

- Prescribe a subgroup $A$ of $\operatorname{PGL}(k, q)$ which must be contained in the automorphism group of the point (multi-)set $P$
- $a \in P G L(k, q)$ is automorphism of $P$ iff $[p \in P \Leftrightarrow a(p) \in P]$
- Instead of choosing single points of $P G(k-1, q)$, we now select complete orbits under the action of $A$ on the points $\Rightarrow$ number of variables is reduced to the number of orbits

## A possible approach:

- Prescribe a subgroup $A$ of $\operatorname{PGL}(k, q)$ which must be contained in the automorphism group of the point (multi-)set $P$
- $a \in P G L(k, q)$ is automorphism of $P$ iff $[p \in P \Leftrightarrow a(p) \in P]$
- Instead of choosing single points of $P G(k-1, q)$, we now select complete orbits under the action of $A$ on the points $\Rightarrow$ number of variables is reduced to the number of orbits
- Let $p$ be a point of $P G(k-1, q), H$ be a hyperplane and $a \in A$. Then we have: $p \in H \Leftrightarrow a(p) \in a(H)$.

## A possible approach:

- Prescribe a subgroup $A$ of $\operatorname{PGL}(k, q)$ which must be contained in the automorphism group of the point (multi-)set $P$
- $a \in P G L(k, q)$ is automorphism of $P$ iff $[p \in P \Leftrightarrow a(p) \in P]$
- Instead of choosing single points of $P G(k-1, q)$, we now select complete orbits under the action of $A$ on the points $\Rightarrow$ number of variables is reduced to the number of orbits
- Let $p$ be a point of $P G(k-1, q), H$ be a hyperplane and $a \in A$. Then we have: $p \in H \Leftrightarrow a(p) \in a(H)$.
$\Rightarrow$ number of equations is reduced to the number of orbits of $A$ on the hyperplanes.

## Example $(\mathrm{q}=3, \mathrm{k}=3)$

|  | 0 0 1 | 0 1 0 | 0 1 1 | 0 1 2 | 0 | 1 0 1 | 1 0 2 | 1 1 0 | 1 1 1 | 1 1 2 | 1 2 0 | 2 | 1 <br> 2 <br> 2 |

|  |  | 3 |  | 3 |  | 3 |  | 3 | 3 | 1 |

## Example ( $q=3, k=3$ )

## The reduced system:

$$
\begin{aligned}
& \left(\begin{array}{lllll}
1 & 1 & 0 & 2 & 0 \\
2 & 1 & 1 & 0 & 0 \\
1 & 0 & 1 & 1 & 1 \\
0 & 3 & 0 & 0 & 1 \\
0 & 1 & 2 & 1 & 0
\end{array}\right) \quad x \leq\left(\begin{array}{l}
n-d \\
n-d \\
n-d \\
n-d \\
n-d
\end{array}\right) \\
& \left(\begin{array}{lllll}
3 & 3 & 3 & 3 & 1
\end{array}\right) \quad x=\quad x
\end{aligned}
$$

## A heuristic solution algorithm:

## A heuristic solution algorithm:

- Input: (In-)equation system of type

$$
\begin{gathered}
A x \leq c \quad(\text { indices } 0 \ldots m-1) \\
B x=d \quad(\text { index } m) \\
\text { with } x \in \mathbb{N}_{0}^{n}, A \in \mathbb{N}^{m \times n}, c \in \mathbb{N}^{m}, B \in \mathbb{N}_{+}^{1 \times n}, d \in \mathbb{N}_{+} .
\end{gathered}
$$

## A heuristic solution algorithm:

- Input: (In-)equation system of type

$$
\begin{gathered}
A x \leq c \quad(\text { indices } 0 \ldots m-1) \\
B x=d \quad(\text { index } m) \\
\text { with } x \in \mathbb{N}_{0}^{n}, A \in \mathbb{N}^{m \times n}, c \in \mathbb{N}^{m}, B \in \mathbb{N}_{+}^{1 \times n}, d \in \mathbb{N}_{+} .
\end{gathered}
$$

- Output: solution of the system or 'search failed'

## A heuristic solution algorithm:

- Input: (In-)equation system of type

$$
\begin{gathered}
A x \leq c \quad(\text { indices } 0 \ldots m-1) \\
B x=d \quad(\text { index } m) \\
\text { with } x \in \mathbb{N}_{0}^{n}, A \in \mathbb{N}^{m \times n}, c \in \mathbb{N}^{m}, B \in \mathbb{N}_{+}^{1 \times n}, d \in \mathbb{N}_{+} .
\end{gathered}
$$

- Output: solution of the system or 'search failed'
- Remark: algorithm can easily be generalized to other problems.

Choice of the variable to be increased next:

Choice of the variable to be increased next:

- For each variable $v$ do the following:

Choice of the variable to be increased next:

- For each variable $v$ do the following:
- compute left hand sides after increase of $v$ and store it in initialLHS[0..m]

Choice of the variable to be increased next:

- For each variable $v$ do the following:
- compute left hand sides after increase of $v$ and store it in initialLHS[0..m]
- set counter $[0]=\operatorname{counter}[1]=\ldots=\operatorname{counter}[m-1]=0$

Choice of the variable to be increased next:

- For each variable $v$ do the following:
- compute left hand sides after increase of $v$ and store it in initialLHS[0..m]
- set counter $[0]=\operatorname{counter}[1]=\ldots=\operatorname{counter}[m-1]=0$
- do $n_{s}$ sample runs ( $n_{s}$ being a number fixed by the user)

Choice of the variable to be increased next:

- For each variable $v$ do the following:
- compute left hand sides after increase of $v$ and store it in initialLHS[0..m]
- set counter $[0]=\operatorname{counter}[1]=\ldots=\operatorname{counter}[m-1]=0$
- do $n_{s}$ sample runs ( $n_{s}$ being a number fixed by the user)
- set eval $(v):=\prod_{j=0}^{m-1} \frac{\text { counter }[j]}{n_{s}}$

Choice of the variable to be increased next:

- For each variable $v$ do the following:
- compute left hand sides after increase of $v$ and store it in initialLHS[0..m]
- set counter $[0]=\operatorname{counter}[1]=\ldots=\operatorname{counter}[m-1]=0$
- do $n_{s}$ sample runs ( $n_{s}$ being a number fixed by the user)
- set eval $(v):=\prod_{j=0}^{m-1} \frac{\text { counter }[\mathrm{j}]}{n_{s}}$
- choose $v^{*}$ so that eval $\left(v^{*}\right)$ is maximal

Pseudocode for a single sample run:

```
for (int i=0; i<=m; i++){ //restore initial LHS
    LHS[i]=initialLHS[i];
}
while(LHS[m]<RHS[m]){ //increase vars randomly
    randomly choose a variable w;
    increase w by 1;
    update LHS[0],LHS[1],...,LHS[m-1],LHS[m];
}
if (LHS[m]==RHS[m]){ //update counters
    for (i=0; i<m; i++){
        if (LHS[i]<=RHS[i]){
                counter[i]++;
        }
    }
```

\}

With the method presented we could construct the following new linear binary codes:

$$
k=11:
$$

$$
k=12:
$$

$$
k=13:
$$

| $n$ | $d$ |
| ---: | ---: |
| 41 | $\mathbf{1 6}$ |
| 73 | $\mathbf{3 2}$ |
| 81 | 34 |
| 136 | 62 |
| 139 | $\mathbf{6 4}$ |
| 146 | 66 |
| 149 | 68 |
| 155 | $\mathbf{7 2}$ |

| $n$ | $d$ |
| ---: | ---: |
| 74 | $\mathbf{3 2}$ |
| 83 | 34 |
| 99 | 42 |
| 102 | 44 |
| 107 | 46 |
| 110 | 48 |
| 140 | $\mathbf{6 4}$ |

| $n$ | $d$ |
| ---: | ---: |
| 41 | $\mathbf{1 4}$ |
| 155 | 68 |
| 158 | 70 |
| 161 | 72 |

(entries in boldface belong to optimal codes)

## Thanks for your attention!
