# Example

# Example

7 different degree sequences

# Partition

A *partition* is a weakly decreasing sequence of non-negative integers, where almost all numbers are zero.

$$\lambda = 3, 3, 2, 2, 1, 1, 0, \dots$$

# Partition

A *partition* is a weakly decreasing sequence of non-negative integers, where almost all numbers are zero.

$$\lambda = 3, 3, 2, 2, 1, 1, 0, \dots$$

The *weight* of a partition is the sum over this sequence.

$$|\lambda| = 12$$

# Partition

A *partition* is a weakly decreasing sequence of non-negative integers, where almost all numbers are zero.

$$\lambda = 3, 3, 2, 2, 1, 1, 0, \dots$$

The *weight* of a partition is the sum over this sequence.

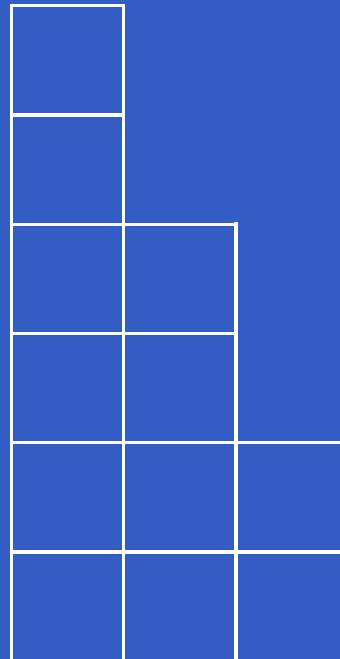

$$|\lambda| = 12$$

The *length* of a partition is the number of nonzero parts.

$$l(\lambda) = 6$$

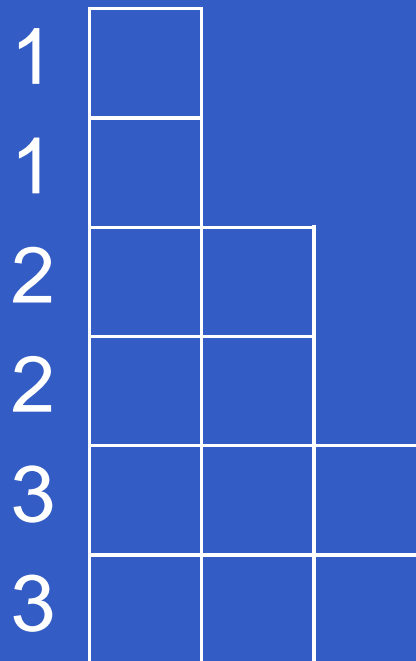

# Ferrers Diagram

Partitions are visualized by left adjusted boxes in the first quadrant.

# Ferrers Diagram

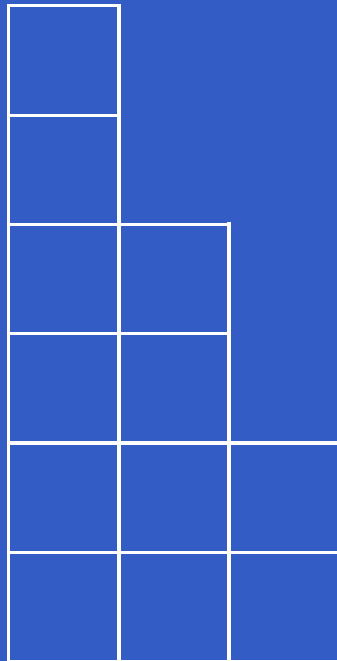

Partitions are visualized by left adjusted boxes in the first quadrant.

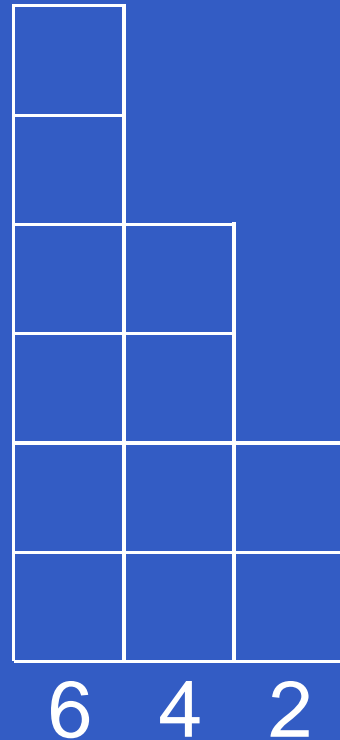

# Conjugate Partition

The *conjugate* partition  $\lambda'$  is the sequence of numbers of boxes in the columns.

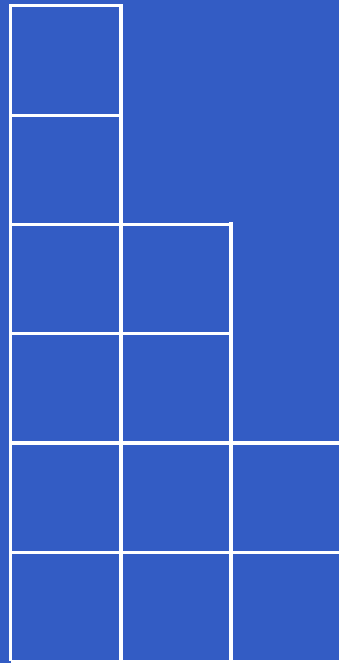

# Conjugate Partition

The *conjugate* partition  $\lambda'$  is the sequence of numbers of boxes in the columns.

# Conjugate Partition

The *conjugate* partition  $\lambda'$  is the sequence of numbers of boxes in the columns.

$$6 \quad 4 \quad 2 = (3, 3, 2, 2, 1, 1)'$$

# Graphical Partitions

A partition  $\lambda$  is called *graphical*, if there is a simple (undirected, no loops, no multi-edges) graph whose vertex degree sequence equals  $\lambda$ .

# Graphical Partitions

A partition  $\lambda$  is called *graphical*, if there is a simple (undirected, no loops, no multi-edges) graph whose vertex degree sequence equals  $\lambda$ .

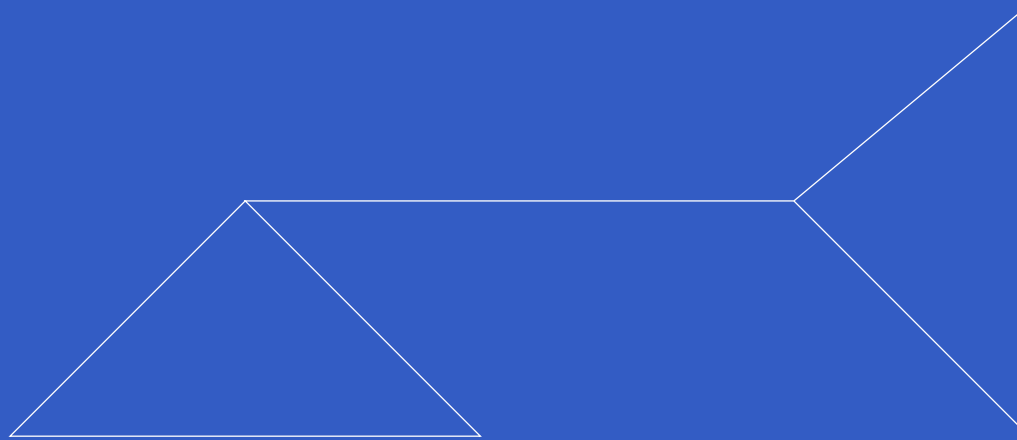

- graphical partitions only exist for even weight

# Graphical Partitions

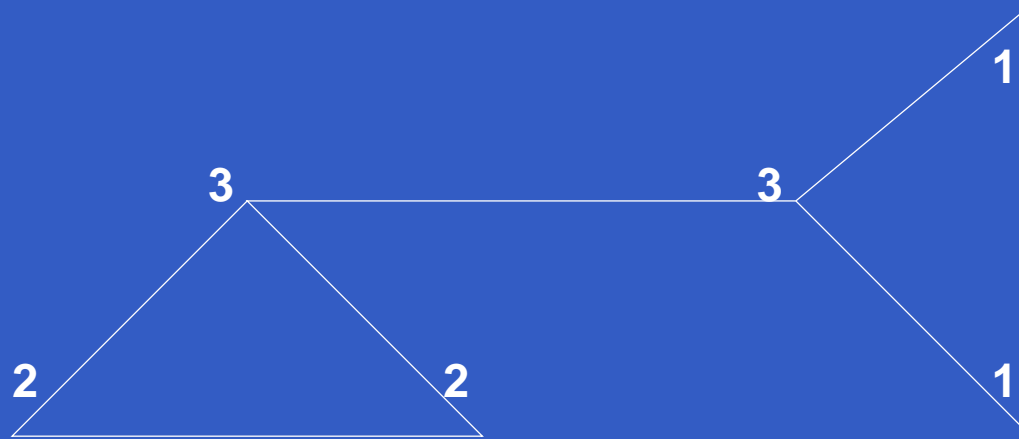

A partition  $\lambda$  is called *graphical*, if there is a simple (undirected, no loops, no multi-edges) graph whose vertex degree sequence equals  $\lambda$ .

- graphical partitions only exist for even weight
- not all even weight partitions are graphical

# Example

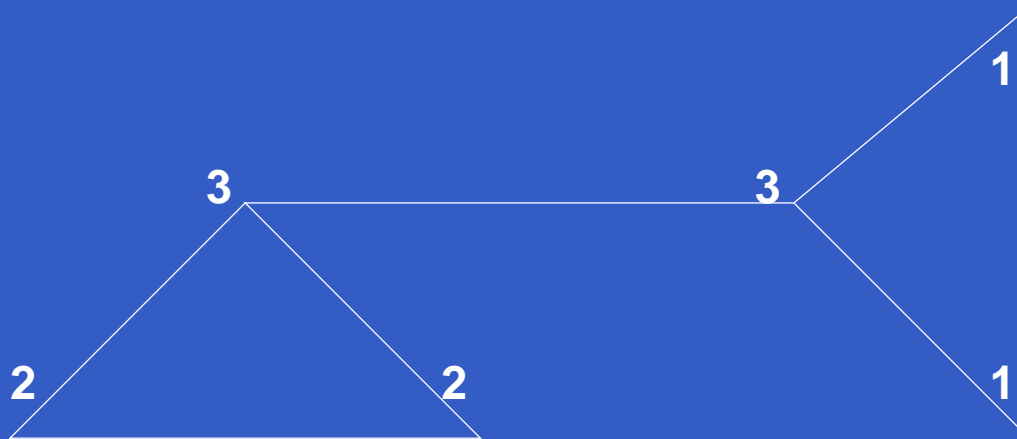

# Example

# Example

3,3,2,2,1,1

# Problem

We want

$g(n) :=$  number of graphical partitions of length  $n$ .

# Problem

We want

$g(n) :=$  number of graphical partitions of length  $n$ .

For general partitions only useful in the case of a maximal size of parts ( $< n$ )

# Problem

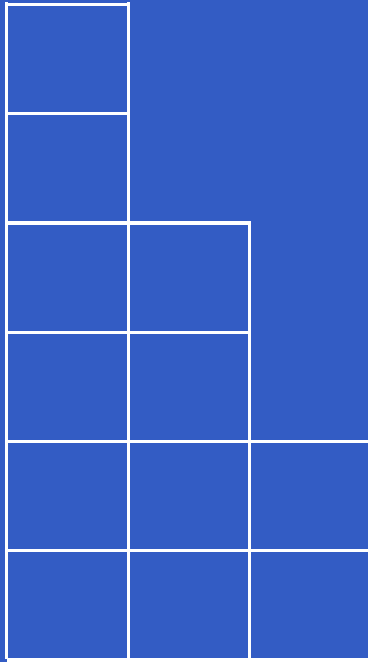

We want

$g(n) :=$  number of graphical partitions of length  $n$ .

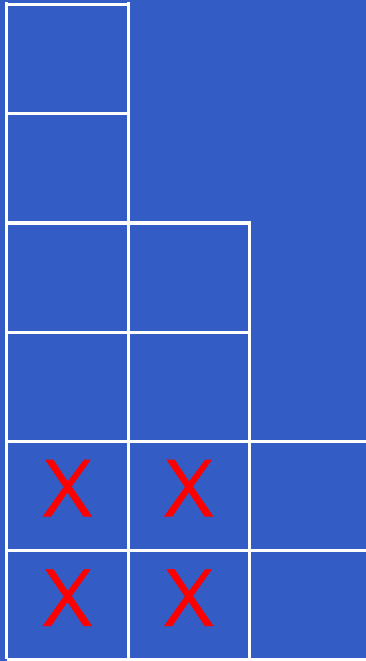

For general partitions only useful in the case of a maximal size of parts ( $< n$ )

		$\binom{2n-2}{n}$
$\vdots$	$n$	
		$n - 2$

# Durfee

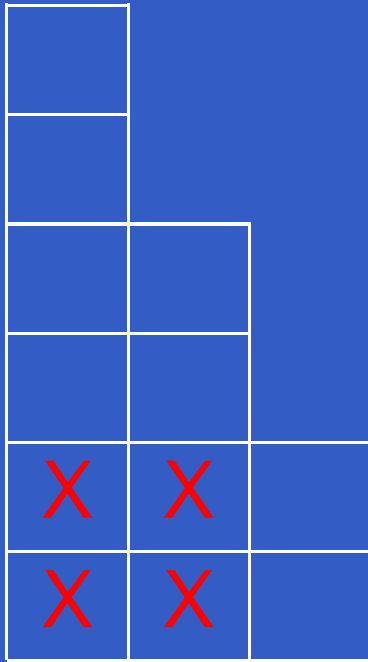

# Durfee

Durfee square =  $(2, 2)$

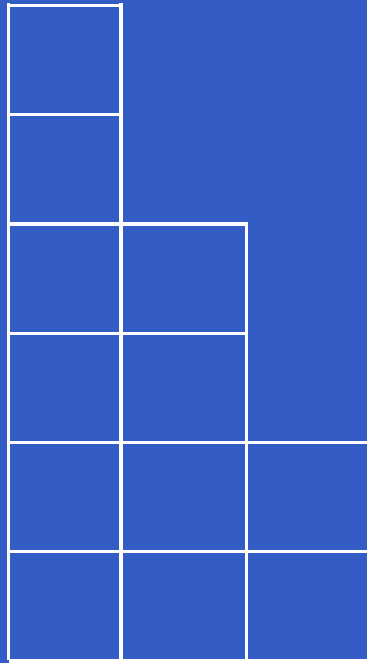

# Durfee

Durfee square =  $(2, 2)$

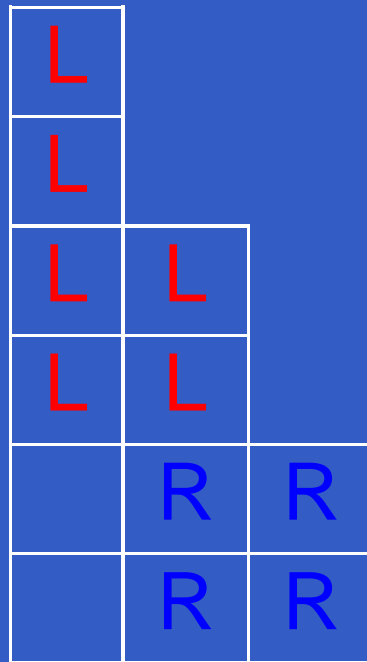

Durfee size = 2

# Durfee Decomposition

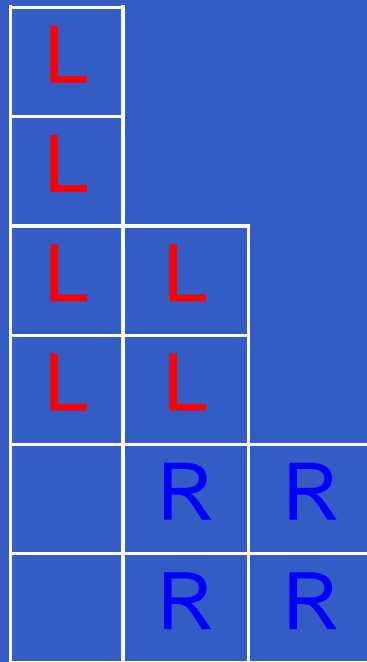

# Durfee Decomposition

# Durfee Decomposition

$$L = (4, 2)$$

$$R = (2, 2)$$

# Dominance Order

The 'natural' partial order on partitions.  
Let  $\mu, \nu$  be two partitions

$$\mu \triangleright \nu \Leftrightarrow \forall k \geq 1 : \sum_{i=1}^k \mu_i \geq \sum_{i=1}^k \nu_i$$

# Dominance Order

The 'natural' partial order on partitions.  
Let  $\mu, \nu$  be two partitions

$$\mu \succeq \nu \Leftrightarrow \forall k \geq 1 : \sum_{i=1}^k \mu_i \geq \sum_{i=1}^k \nu_i$$

Dominance order is compatible with graphical partitions:

$$\nu \text{ graphical, } \mu \succeq \nu \Rightarrow \mu \text{ graphical}$$

# Criterion

## Theorem:

A partition  $\lambda$  of even weight is graphical

$$L(\lambda) \supseteq R(\lambda)$$

# Recursion Formula (1)

$G(n)$  := set of graphical partitions of length  $n$

$G_s(n)$  := set of graphical partitions of length  $n$   
and maximal part of size  $s$

$$G(n) = G_1(n) \dot{\cup} \dots \dot{\cup} G_{n-1}(n)$$

# Recursion Formula (1)

$G(n)$  := set of graphical partitions of length  $n$

$G_s(n)$  := set of graphical partitions of length  $n$   
and maximal part of size  $s$

$$G(n) = G_1(n) \dot{\cup} \dots \dot{\cup} G_{n-1}(n)$$

Each  $G_s(n)$  is decomposed into disjoint subsets according to the weight

$$G_s(n) = G_{s,2}(n) \dot{\cup} \dots \dot{\cup} G_{s,n*(n-1)}(n)$$

# Recursion Formula (2)

Each set  $G_{s,w}(n)$  is decomposed according to the size of the Durfee square

$$G_{s,w}(n) = G_{s,w,1}(n) \dot{\cup} \dots \dot{\cup} G_{s,w,n-1}(n)$$

# Recursion Formula (2)

Each set  $G_{s,w}(n)$  is decomposed according to the size of the Durfee square

$$G_{s,w}(n) = G_{s,w,1}(n) \dot{\cup} \dots \dot{\cup} G_{s,w,n-1}(n)$$

From the Durfee decomposition and the criterion we get a bijection:

$$G_{s,w,d}(n) \longleftrightarrow$$

$$\mu \triangleright \nu$$

$$\{ (\mu, \nu) \text{ with } 1 \leq l(\mu) \leq d, \mu_1 = n - d, l(\nu) = id \}.$$

$$|\nu| + |\mu| = n - (d - 1) * d$$

# Recursion Formula (3)

$$P(s_1, l_1, w_1, l_2, w_2) := \text{pairs } (\mu, \nu) \text{ with}$$
$$\mu \triangleright \nu, \mu_1 = s_1$$
$$l(\mu) = l_1, |\mu| = w_1$$
$$l(\nu) = l_2, |\nu| = w_2$$

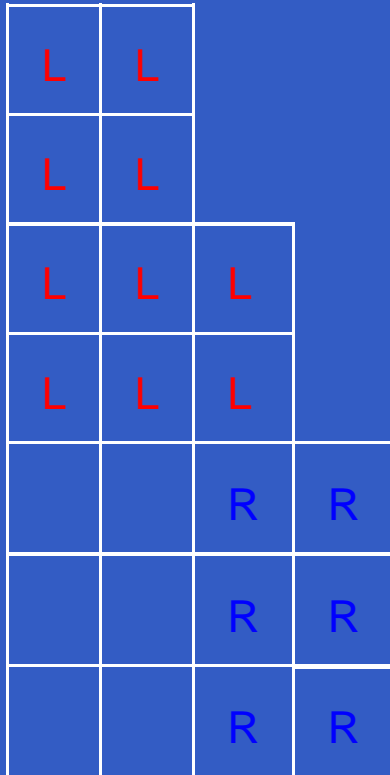

# Recursion Formula (3)

$$P(s_1, l_1, w_1, l_2, w_2) := \text{pairs } (\mu, \nu) \text{ with}$$
$$\mu \triangleright \nu, \mu_1 = s_1$$
$$l(\mu) = l_1, |\mu| = w_1$$
$$l(\nu) = l_2, |\nu| = w_2$$

rewrite above recursion with  $r = n - (d - 1) * d$  :

$$G_{s,w,d}(n) \longleftrightarrow \bigcup_{\substack{j = 1, \dots, d \\ l = 0, \dots, r}} P(n - d, j, l, d, r - l)$$

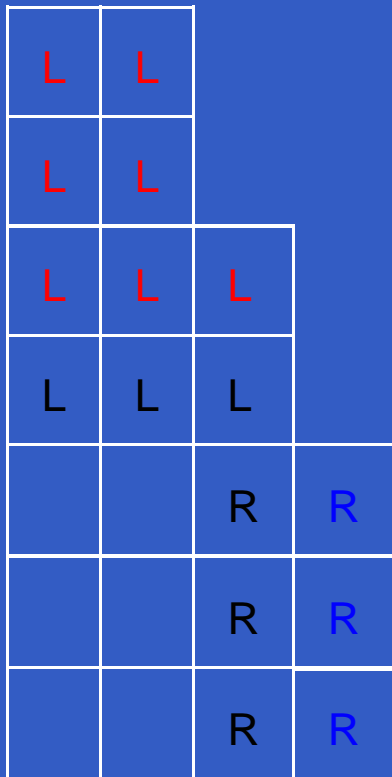

# Recursion Formula (4)

# Recursion Formula (4)

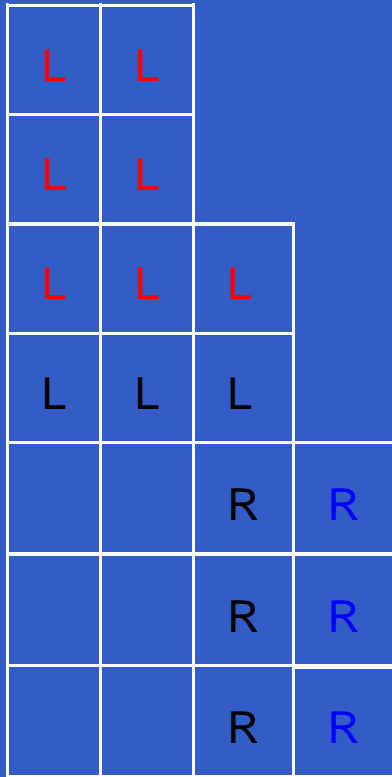

L	L		
L	L		
L	L	L	
L	L	L	
		R	R
		R	R
		R	R

# Recursion Formula (4)

$$P(s_1, l_1, w_1, l_2, w_2)$$

# Recursion Formula (4)

$$P(s_1, l_1, w_1, l_2, w_2)$$

$$P(s_1 - 1, i, w_1 - l_1, j, w_2 - l_2)$$

$$i = 0, \dots, l_1$$

$$j = 0, \dots, l_2$$

# Product Formula

We count pairs  $\mu \succeq \nu$ , with certain properties

# Product Formula

We count pairs  $\mu \trianglerighteq \nu$ , with certain properties  
Unique minimal partition  $\mu^-$ , unique maximal partition  $\nu^+$ .

# Product Formula

We count pairs  $\mu \supseteq \nu$ , with certain properties  
Unique minimal partition  $\mu^-$ , unique maximal partition  $\nu^+$ .

If  $\mu^- \supseteq \nu^+$  then (with  $p(..) = |P(..)|$ )

$$p(s_1, l_1, w_1, l_2, w_2) = p(s_1, l_1, w_1, 0, 0) \left( \sum_{i=1, \dots, w_2 - l_2 + 1} p(i, l_2, w_2, 0, 0) \right).$$

# Concluding Remarks

Limiting factors:

memory to store intermediate results

time if you do not store intermediate results
